A 66-year-old woman presented with 4 years of progressive speech difficulty. She had nonfluent speech with phonemic errors but intact single-word comprehension and object knowledge. Her grammar was impaired in both speech and writing, and she exhibited orofacial apraxia. A clinico-radiologic (see figure) diagnosis of nonfluent variant primary progressive aphasia was made.

Nonfluent variant primary progressive aphasia is a neurodegenerative disease within the spectrum of frontotemporal dementia, characterized by the typical language and brain atrophy patterns seen here.<sup>1</sup> It is most frequently due to tau pathology, and clinicians should be alert to the potential development of progressive supranuclear palsy or corticobasal syndrome.<sup>2</sup>

## AUTHOR CONTRIBUTIONS

C.R.M.: image selection and drafting of the manuscript. C.J.D.H., M.N.R., J.D.W.: critical revisions of the manuscript.

Coronal volumetric T1-weighted MRI showing asymmetric atrophy of left insula and opercular inferior frontal gyrus (arrow), a pattern typical of nonfluent variant primary progressive aphasia.

## STUDY FUNDING

The Dementia Research Centre is grateful for the support of the NIHR Queen Square Dementia Biomedical Research Unit. The Article Processing Charge was paid by Wellcome Trust.

## DISCLOSURE

C. Marshall is funded by a clinical fellowship from the Leonard Wolfson Experimental Neurology Centre at UCL. C. Hardy holds an MRC PhD studentship. M. Rossor is an NIHR investigator. J. Warren is a Wellcome Trust Senior Fellow. Go to [Neurology.org](http://Neurology.org) for full disclosures.
